Dear editor

The aim of this work is interesting especially because it concerns the possible record of abrupt climatic changes, such as Heinrich Events, in the Mesozoic. However, the results presented in this paper are not well constrained. The different data used to show climatic variations, are not clearly explained and presented. Some data presented in the figures are not explained in the text ; comments on the results are confused ; some figures such as A1 and A2 are the same ! the spectral analysis is not convincing and finally the authors did not used it as well. The discussion part misses references concerning Late Cretaceous climate and paleocanography which are never taking into consideration. I wrote different remarks directly on the manuscript This work needs deep revision before to be published.

Fabienne Giraud
